

1. I planed to research different tech stacks. I first checked out flutter and react native which seemed well. Then Alan discovered xamarin which is now owned by microsoft and they renamed it to .NET MAUI which is framework we are deciding to go with. We all have experience in c# it will work great with MySQL and deploy in both ios, android, macOS, and windows which is exciting.
2. This week was pretty chill, but we are getting to it. We just set up the board so next report will be better
  - a. Alan took lead and set up our github and project board on github and he did in deed accomplish those tasks.
  - b. Everyone else researched into different tech stacks for deployment of our mobile app and we had a discussion this week where we all brought what we thought would be best and we came to a conclusion of using .NET MAUI
3. A win would be choosing the .NET MAUI and looking into it get us all very excited for our project since we are all very familiar with C# and our Github is set up :)
4. We are going to get the mysql database up and running. Kevin is taking head on this project.
